Project Title: E-commerce Website

Team Name: The Chess

Introduction:

For this Project Work-II course, we are going to build an E-commerce website for an online watch store. We will try to keep our project simple and user friendly.

Project Platform:

- JAVA SCRIPT
- REACT JS
- REDUX
- MONGODB
- NODE JS
- HTML
- CSS

Project Description:

There will be two parts to our website, one is for users and another one is for the admin panel. In the users, UI users can view all the items and can add them to the cart if they want, but one can not place any order without valid registration and login. Users can delete any items from the cart. In the admin panel, the admin can add or remove any products. Admin can track the orders from customers. Admins will also go through a login process. That is our primary goal, but we will try to add customers' reviews and ratings for every individual product. We will also try to add search bar to find the products easily by customers.

[We will use the images from the official Rolex website. Also, we will name them after them.]
